OPERATIONAL & MAINTENANCE CARE FOR GRP PRODUCTS

Lifting

Items weighing 20kg or less can be lifted manually or with a forklift. Any product larger than 1.5mtrs in length should be held at either end to avoid over bending.

Fixing

When drilling or cutting GRP products, safety glasses and face masks should be worn. Also, protective gloves may be necessary to avoid possible injury from the material splintering.

If using pigmented filler to cover screw heads and joints, vinyl or latex gloves should be worn, together with eye protection.

On-going Maintenance

Products can be cleaned with an all purpose detergent with hot water and a brush/sponge and be left to air-dry.

In certain circumstances some products may be painted with regular interior or exterior paint (depending on location).
